To Whom It May Concern,

HOC recently heard about this water unit and checked it out, we were so impressed that we decided to order the units for our clinics.

We have studied the science behind the unit and were so convinced of its validity that we have ordered a water unit for our 4 clinics. We will be using it as part of my TCR (tissue cleansing and restoration) program. In the TCR program, seriously ill patients are in the clinic for several hours every day for about six weeks. During their treatment, which includes 3 hours of sauna daily, these individuals drink a lot of water. Up till now I've had to depend on bottled water. Now, I can give them something that is much better than bottled water. I can give them water that will actually help the body accelerate its healing process. The **REGENCY II** Ionizer unit may not be the Fountain of Youth, but it's clearly a step in the right direction.

The main reason HOC purchased a **REGENCY II** Ionizer unit is because it changes the electrical charge in the water, thus making it either a powerful antioxidant (alkaline), or an oxidant (acidic). The antioxidant water penetrates into every cell of the body to protect DNA from damage and to reduce inflammation. It also alters the pH in the body, which is helpful in many diseases, including diabetes and cancer. It even prevents the putrefaction of food in the GI tract thus reducing the production of embarrassing gas.

By the way, antioxidant water is also excellent for endurance athletes or athletes who do intense workouts. A great deal of oxidant damage results from athletic activity. This is why marathon runners often don't feel well or come down with an infection soon after an event. Drinking antioxidant water during and after the event can prevent these problems.

Our patients will also have a use for the oxidant (acidic) water. If they have a small wound or any kind of a skin disorder such as psoriasis, acne, eczema, the application of oxidized water will kill microorganisms and speed up healing. They can also use it as a mouthwash to reduce bacteria levels. Since bacteria in the mouth are responsible for plaque, healthier teeth could result.

There's another important use for oxidized water. New research has revealed an epidemic of parasitic and other infections in this country. Most of these infections are in the GI tract (parasites, bacteria) or the liver (viral hepatitis). Contamination of fresh vegetables and fruits that we eat, whether from the grocery store or in restaurants, is partly at fault. So it is very important for you to reduce your exposure. You can do this by dipping your fresh food into oxidized water, which will kill the microorganisms. You should always wash your cutting board with oxidized water, especially after cutting meat or poultry. These products are coated with bacteria, possibly including Salmonella. You should also wash your hands with oxidized water.

Sincerely,

Dr Zayd Ratansi, N.D.
